Year 8 IDU

Science and PHE

Heart and Lungs

Statement of Inquiry:	The connections between human body systems have consequences for personal physical wellbeing and movement .
Key Concept:	Connections
Related Concepts:	Consequences and Movement

8C MYP Command Terms

Term	Definition
Analyse	Break down in order to bring out the essential elements or structure. To identify parts and relationships, and to interpret information to reach conclusions.
Apply	Use knowledge and understanding in response to a given situation or real circumstances
Describe	Give a detailed account or picture of a situation, event, pattern or process
Design	Produce a plan, simulation or model
Discuss	Offer a considered and balanced review that includes a range of arguments, factors or hypotheses. Opinions or conclusions should be presented clearly and supported by appropriate evidence
Document	Credit sources of information used by referencing (or citing), following one recognized referencing system. References should be included in the text and also at the end of the piece of work in a reference list or bibliography
Evaluate	Make an appraisal by weighing up the strengths and limitations
Explain	Give a detailed account
Formulate	Express precisely and systematically the relevant concept(s) or argument(s)
Interpret	Use knowledge and understanding to recognize trends and draw conclusions from given information
Outline	Give a brief account
Present	Offer for display, observation, examination or consideration
Recall	Remember or recognize from prior learning experiences
Select	Choose from a list or group
Solve	Obtain the answer(s) using appropriate methods
State	Give a specific name, value or other brief answer without explanation or calculation
Suggest	Propose a solution, hypothesis or other possible answer
Summarize	Abstract a general theme or major point(s)

Glossary: Heart and Lungs

Word	Meaning
diet	The food that you eat.
fibre	Substance found in food which cannot be used by the body. It helps to keep our intestines clean.
nutritional information	Information label found on a food packet to tell you what is in the food.
nutrients	Substances needed in the diet to provide raw materials.
raw materials	Substances used to make other substances out of.
starch	Type of insoluble carbohydrate found in plants.
water	A compound made of hydrogen and oxygen which the body uses as a solvent.
balanced diet	Eating a wide variety of foods to give us all the things that we need.
carbohydrate	Substance found in food that is used for energy.
chemical energy	Energy stored in chemicals like food.
fat	Substance found in food that is stored to be used for energy in the future. It also helps to keep heat in our bodies.
heart disease	Disease caused by narrowing of the arteries carrying the blood to the muscles of the heart, so the heart muscles do not receive enough oxygen.
kilojoule (kJ)	Unit of energy used on food packets. There are 1000 J in 1 kJ.
mineral	Properly called a 'mineral salt' and found in food. Needed in small quantities for health (e.g. calcium).
protein	Substance found in food that is used for growth and repair.
starch	Type of insoluble carbohydrate found in plants.
sugar	Type of soluble carbohydrate. Glucose is an example of a sugar.
vitamin	Substance found in food that is needed in small quantities for health (e.g. vitamin C).

absorbed	When soluble substances go through the wall of the small intestine into the blood.
anus	The opening at the end of the gut.
appendix	Small tube branching off the large intestine. It has no function in humans.
contract	Something gets smaller.
digestion	Process that breaks food into soluble substances in our bodies.
digestive juices	A liquid containing enzymes that break down food.
digestive system	A group of organs that carry out digestion.
egestion	When faeces are pushed out of the anus.
enzyme	A chemical that can break up large molecules.
faeces	Waste food material produced by the intestines.
feeding	Putting food into your mouth. Also called ingestion.

fibre	Substance found in food which cannot be used by the body. It helps to keep our intestines clean.
gullet	Tube that goes from the mouth to the stomach. Sometimes called the 'food pipe' but properly called the oesophagus.
gut	All the organs of the digestive system apart from the mouth.
ingestion	Putting food into your mouth.
insoluble	Something that does not dissolve is said to be insoluble.
large intestine	Organ that takes water out of waste food.
molar	Grinding tooth at the back of the mouth.
rectum	Organ that stores faeces before they are egested.
saliva	A digestive juice. It contains an enzyme that breaks down starch into sugar.

absorbed	When soluble substances go through the wall of the small intestine into the blood.
amylase	An enzyme found in saliva that breaks starch down into sugar.
aerobic respiration	Process that releases energy from digested food. Needs oxygen from the air. Carbon dioxide is produced as a waste gas.
glucose	A type of sugar.
product	New chemical formed in a chemical reaction.
reactant	Chemical that is used up in a chemical reaction.
respiration	Process that uses up oxygen to release energy from food. Carbon dioxide is produced as a waste gas.
word equation	A way of writing out what happens in a chemical reaction.
aerobic respiration	Process that uses up oxygen to release energy from food. Carbon dioxide is produced as a waste gas.
air sacs	Groups of alveoli in the lungs where oxygen comes out of the air and goes into the blood. Carbon dioxide is also transferred from the blood to the air in these.
alveolus	Small, round pocket that is grouped with other alveoli to form air sacs in the lungs. Plural = alveoli.
blood	Contains cells and a liquid called plasma. It flows around the body carrying various substances which are either made by the body or needed by the body.
breathing	Moving muscles in order to make air flow into and out of the lungs.
breathing system	Set of organs (lungs, windpipe, diaphragm) that allow air to be taken into and out of the body.
bronchus	Tube in the lungs that connects the windpipe to the air sacs. Plural = bronchi.
cilia	Small hairs on the surface of some cells.
ciliated epithelial cell	Cells with cilia that are found in the lungs.
diffusion	The natural movement of particles from a place where there are a lot of them to a place where there are fewer of them.

digestive system	The group of organs that carry out digestion.
exhale	To breathe out.
gas exchange	Taking oxygen into the blood and getting rid of carbon dioxide into the lungs. Happens in the air sacs in the lungs.
inhale	To breathe in.
mucus	Slimy substance which traps dirt and microbes and is moved out of the lungs by cilia.
red blood cells	Cells in the blood that carry oxygen.
respiratory system	System containing the lungs, bronchi and trachea.
trachea	Windpipe.
ventilation	Air moving into and out of the lungs.

absorb	To take in, e.g. when soluble substances pass through the wall of the small intestine and into the blood.
artery	Blood vessel that carries blood away from the heart.
capillaries	The smallest blood vessels. Substances enter and leave the blood through the thin walls of capillaries.
chamber	The heart contains four compartments called chambers.
circulatory system	System containing the heart and blood vessels.
heart	Organ that pumps blood around the body.
plasma	Part of the blood. A liquid that surrounds the blood cells.
pulse	The feel of your blood being pumped.
pulse rate	The number of times you can feel your blood being pumped in one minute.
red blood cells	Cells in the blood that carry oxygen.
tissue fluid	The liquid formed when plasma leaks out of capillaries, carrying oxygen and food to cells.
vein	Blood vessel that carries blood to the heart.

8 IDU 1a Making Connections

Inquiry Questions:

To a large extent: governments fund PE, sport facilities, food labelling and health campaigns. But promotion varies between countries and is limited by cost, culture and industry influence.

Factual

What is the structure and function of the circulatory system?
 What is the structure and function of the respiratory system?
 What are the essential nutrients for a balanced diet?
 What are the short and long term effects of exercise on the body systems?
 How do organisms have energy for life functions?

Conceptual

How do body systems adapt to changing training methods?
 How does a circuit plan address areas of cardio & muscular strength, and endurance?

Structure: nose, trachea, bronchi, bronchioles and alveoli.
 Function: takes oxygen into the blood and removes carbon dioxide (gas exchange) so cells can respire.

Debatable

To what extent do global governments promote health and fitness?
 To what extent does a health and nutrition address physical wellness?

Nutrients are carbohydrates, proteins, fats, vitamins, minerals, fibre and water. They are essential for energy, growth, repair and health in the right proportions - a balanced diet.

Short term: heart rate, breathing rate and temperature rise, sweating, muscles use more oxygen. Long term: stronger heart and muscles, lower resting pulse, larger lung capacity, better stamina.

Adaptations are specific to the training: aerobic work enlarges the heart and increases capillaries and lung capacity; resistance work increases muscle strength and muscular endurance.

A circuit plan uses stations that alternate cardiovascular exercise with resistance exercise and rest, so cardio, muscular strength and muscular endurance are all trained.

8 IDU 1b Exercise and Nutrition Journal

Task Instructions:

Design a journal template to record your exercise and nutrition over a one-week period of time.

This journal is personal to you and will only be shared with your fellow students if you are comfortable doing so.

Be as honest as possible. We will revisit this exercise and nutrition journal periodically over the course of the IDU and see if your awareness of nutrition and its impact on your health and body systems has increased.

A simple design template that can be used and altered is shown below to assist you.

Journal Entry Date: _____

Day of the Week	Exercise Record	Nutrition Record
	Design a weekly table with one row per day: Date, Day of the week, Exercise done (type, time, intensity), Food and drink eaten at each meal, and a comment on how I felt.	

8 IDU 2a Food for Thought

1 Use the words in the box to complete the sentences.

diet energy fats fibre minerals
nutrients raw repair water

What we eat is known as our diet. Our food provides a source of _____ materials to make new substances.

These new substances are used for:

- _____ (to help us to move, etc.)
- growth and _____
- health.

Carbohydrates, proteins, minerals, vitamins and _____

We also need to eat water and drink _____.

BLOGGS CRUNCHY BAR							
N U T R I T I O N I N F O R M A T I O N							
		Per 100g		Per 25g bar		Per 100 g	
							Per 25g bar
Energy	kJ	436	109	Vitamin B1	mg	1.4	0.35
Protein	g	7.6	1.9	Vitamin B2	mg	1.6	0.40
Carbohydrate	g	60.4	15.1	Vitamin B3	mg	18	4.50
Fat	g	18.4	4.6	Calcium	mg	800	200
Fibre	g	4.5	1.13				

2 Use the nutrition information label above to answer these questions.

a How much protein is there in 100 g of the food? _____

b How much fat would you get if you ate two of these bars? _____

raw
energy

c Name one vitamin shown on the label. Vitamin B1.

d Name one mineral shown on the label. Calcium.

repair

e Which of the food substances listed helps the rest of your food to pass through your intestines as it is being digested? _____

fibre
 7.6 g of protein in 100 g.
 36.8 g (18.4 g fat in each 100 g bar, so $18.4 \times 2 = 36.8$ g).
 Fibre - it cannot be digested, so it helps the rest of the food pass through the intestines.

8 IDU 2b 'A Big Burger Meal'

Answer the questions about this meal. You can use the words listed below to help you.

carbohydrate
energy
fat
growth and repair
health
minerals
protein
sugar
vitamins
water

1 Name one type of food substance that might be found in each part of the Big Burger meal and say why the body needs it.

a Breadroll
carbohydrate (starch)

Food substance: _____

Why the body needs it: It is digested to glucose, which is used in respiration to release energy

b Beef
protein

Food substance: _____

Why the body needs it: For growth and repair of body cells and tissues.

c. Tomato
vitamins (and minerals)

Food substance: _____

Why the body needs it: body needs it: amounts for health, e.g. vitamin C for healthy skin.

2 a The fries are cooked in oil. What food substance does oil contain? _____

b What does the body use this for? for energy - it is stored in the body and also helps to keep us warm.

3 a What substance does the cola drink mainly contain? _____

b What other substance does it contain? _____

c Suggest why this substance might be bad for you if you had too much.
fat

4 a If you only ate this meal, do you think you would get enough vitamins?
sugar

b Explain your answer. _____
water

Sugar gives a lot of energy; too much is stored as fat (weight gain) and it can also decay teeth.

No.

The meal is mainly carbohydrate, protein and fat; only the tomato gives vitamins, which is too little - it has no fruit or vegetables. © Pearson Education Limited 2002

8 IDU 2c Testing for Starch and Fats

The test for starch (a carbohydrate)

Apparatus

- Food samples
- Iodine solution
- Pipette
- Spotting tile
- Water
- Test tubes and stoppers

Iodine will stain your skin.

Method

- 1 Take a small sample of your food. If it is not a powder, go to step 4. If it is a powder, add it and an equal volume of water to a test tube.
- 2 Put the stopper in the test tube and shake for 10 seconds.
- 3 Put five drops in a well on a spotting tile.
- 4 Use a pipette to add two drops of iodine solution. If a **blue-black** colour appears, starch is present.

The test for fat

A blue-black colour appears, which shows that starch is present.

Apparatus

- Food samples
- Piece of plain paper

Method

- 1 Take a sample of your food and rub it into the paper for 20 seconds.
- 2 Carefully remove the food from the paper.
- 3 Hold the paper up to the light. If you can see a **permanent greasy mark**, fat is present.

Recording your results

Fill in this table to show your results.

Name of food	Did it contain starch?	Did it contain fat?

Considering your results/conclusions

How did you know if a food contained starch? _____

The iodine solution turned blue-black, showing that starch was present.

Starch is tested with iodine solution (blue-black = starch present). Fat is tested with the ethanol emulsion test (cloudy white emulsion = fat present).

How did you know if a food contained fat? _____

A permanent greasy mark was left on the paper, showing that fat was present.

Can you tell if some foods contain more starch than others? _____

Yes. The darker the blue-black colour, the more starch the food contains.

Which food contains a small amount of starch? _____

The food that gave only a faint, pale blue-black colour (it had the least starch).

Which of your foods contained the most starch? _____

The food that turned the iodine the darkest blue-black.

Look up the amounts of starch (carbohydrate) in the foods that you tested. Does your answer above match the information that you have found?

Compare them with a food table: the food that gave the strongest blue-black colour should contain the most carbohydrate (starch).

8 IDU 2d Testing for Sugars

Note: This can be done as a demo if required.

Testing for glucose

Apparatus

- Bunsen burner
- Boiling tube
- Tripod
- Pipette
- Heatproof mat
- Benedict's solution
- Pestle and mortar
- Food sample(s)
- Gauze
- Eye protection

Method

- 1 Using a pestle and mortar, mash a small sample of food with an equal volume of water.
- 2 Pour the mashed food into a boiling tube.
- 3 Add 10 drops of Benedict's solution.
- 4 Place the boiling tube into a beaker of water. Heat the beaker until it boils.
- 5 Green, yellow and red colours indicate the presence of glucose.

A green, yellow or red colour shows that glucose is present (blue means no glucose).

Results for Glucose testing

Food	Observation	Conclusion
Bread		
Iceberg Lettuce		
Potato		
Apple juice		

*Testing for sucrose – DO THIS AS A DEMO***Apparatus**

- All the apparatus you needed for testing glucose (see above)
- Dilute hydrochloric acid
- Sodium hydrogen carbonate solution
- Eye protection

**Wear eye protection.****Method**

- 1 Using a pestle and mortar, mash a small sample of food with an equal volume of water.
- 2 Pour the mashed food into a test tube and add about half a volume of dilute hydrochloric acid.
- 3 Place in a beaker of water and boil for 10 minutes.
- 4 Allow the tube to cool down for 5 minutes.
- 5 Add half a volume of sodium hydrogen carbonate solution. Then follow steps 3–5 from the Glucose testing experiment above. Record results in table below.

Results for Sucrose testing

Food	Observation	Conclusion
Bread		
Iceberg Lettuce		
Potato		
Apple juice		

8 IDU 3a The Digestive System

1

Label the parts of the digestive system on the diagram. Use a ruler to draw straight lines and these letters as your labels:

b = B, the small intestine
c = G, the anus
d = E, the gullet (oesophagus)

e = A, the large intestine (colon)

f = D, the stomach

Food molecules are too big to pass through the intestine wall; enzymes break them into small soluble molecules that can be absorbed into the blood.

A - the large intestine (colon)

B - the small intestine

C - the rectum

D - the stomach

E - the gullet (oesophagus)

F - the mouth

G - the anus

· Label the diagram: A = the large intestine (colon), B = the small intestine, C = the rectum, D = the stomach, E = the gullet (oesophagus), F = the mouth, G = the anus; also label the saliva gland.

2

Match the function below to the structure named in question 1.

- a Food is physically digested and mixed with saliva here the mouth
- b This is where most of the digested food is absorbed here the small intestine
- c Faeces is eliminated (egested) here. here the anus
- d Muscle contractions move food along here to the stomach here the esophagus
- e Water is absorbed here. here the large intestine
- f This structure produces acid and digests proteins here the stomach
- g Undigested food is temporarily stored here the rectum

3

Enzymes are chemicals that break up large molecules into smaller ones. There are enzymes in the small intestine. Explain why these are needed here.

8 IDU 3b Process of Digestion

- 1 Complete the sentences using the words in the box.

absorbed	anus	enzymes	intestine
juices	mouth	insoluble	soluble

absorbed
intestine
anus

Digestion makes insoluble substances into _____ ones.

This process starts in the _____. During digestion, digestive
_____ are added to the food. These contain _____

which are special chemicals that can break the bonds in the larger food molecules.

When all the food that can be digested has been broken down, it is _____

by the small _____. Food material like fibre that cannot be broken down

is passed out of the body through the _____.

- 2 For each of the structures below, say what it does to help with digestion:

The stomach: The stomach churns the food and adds acid and enzymes to start digesting protein.

Teeth: Teeth chew and grind food into smaller pieces, giving a larger surface area for enzymes to work on, and mix it with saliva.

- 3 Some food cannot be digested. This is called **fibre**. Write the names of the organs listed in the box in the order that a piece of fibre would go through them.

i i = mouth, ii ii = gullet (oesophagus), iii iii = stomach iii _____

iv iv = small intestine, v v = large intestine, vi vi = rectum vi _____

vii vii = anus _____

anus	gullet	large intestine	mouth	rectum
	small intestine	stomach		

mouth
juices
enzymes

8 IDU 3c Modelling the Small Intestine

It is very difficult to do practical work with a real small intestine but we can make a model of how it works. Visking tubing can be used. This has microscopic holes in it that are too small to see.

Apparatus

- Visking tubing
- Starch solution
- Warm and hot water baths
- Two syringes
- Benedict's solution
- Pipette
- Safety goggles
- Elastic band
- Digestive juice solution (amylase)
- Boiling tube
- Iodine solution
- Beaker
- Two test tubes

Wear eye protection.

Method

- 1 Take some Visking tubing and tie a knot in one end. Using a syringe, carefully add 5 cm³ of starch solution to the tubing.
- 2 Using the other syringe, add 1 cm³ of the digestive juice solution.
- 3 Holding the top of the tubing, wash the outside of it under a tap (to clean off any starch that may have been spilt).
- 4 Place the tubing inside a boiling tube of distilled water and leave the boiling tube in a warm water bath for 20 minutes.
- 5 Label the diagram below including the substances you have added.
- 6 Whilst you are waiting, add 1 cm³ of the original starch solution into a test tube and test using iodine solution.
- 7 Take a second test tube, add another 1 cm³ of starch solution and test using Benedict's solution.

Labels: Visking tubing = the wall of the small intestine; inside the tubing = starch solution + amylase (digestive juice); the water outside = the blood.

- 8 After 20 minutes in the warm water bath, take out your boiling tube and test the water outside the tubing for starch and then for glucose.

Recording your results

- 1 What does iodine solution test for?
- 2 What happened to the starch solution when you added iodine solution?
- 3 What does Benedict's solution test for?
- 4 What happened to the starch solution when you added the Benedict's solution?
- 5 What did you find when you tested the water outside the visking tubing for starch and

glucose? No starch was found outside the tubing (iodine stayed yellow-brown), but glucose was present (Benedict's turned green/yellow/orange).

Considering your results/conclusions

- 1 What do the following things represent in your model small intestine?

- a the visking tubing The wall (lining) of the small intestine.
- b the mixture inside the visking tubing Tubing and digestive juices inside the small intestine.
- c the water outside the visking tubing The blood, which carries the absorbed substances away.

- 2 Name one way in which this model is not like a real small intestine.

It turned blue-black (blue-black/black).

It stayed blue - no glucose was present in the starch solution.

- 3 Why do you think the boiling tube was put into a warm water bath?

To keep it warm, near body temperature (37 C), so the amylase works at its fastest rate.

- 4 Write a conclusion for this experiment.

Starch is too big to pass through the tubing, but amylase digests starch to glucose, which is small and soluble, so it passes through - showing how digested food is absorbed.

8 IDU 4a Testing for Carbon Dioxide Gas

- 1 Select the correct words from the brackets to complete the following sentences:

If I blow into limewater it will change from

_____ (clear/cloudy) to **clear**

_____ (clear/cloudy). This shows that

I breathe out the gas _____

(oxygen/carbon dioxide) **carbon dioxide**

normal air – pink

exhaled air – yellow

air containing less carbon dioxide than normal air – purple

cloudy
pink
yellow
more
less

These tubes all contain hydrogen-carbonate indicator.

Hydrogen-carbonate indicator can detect the amount of carbon dioxide in the air.

In normal air it looks _____ (pink/yellow/purple).

In exhaled air it looks _____ (pink/yellow/purple) because there is

_____ (more/less) carbon dioxide gas in exhaled air than in normal air.

It looks **purple** in air containing _____ (more/less) carbon dioxide than normal air.

Body temperature can be measured using a _____ (measuring cylinder/thermometer) **thermometer**

Normal body temperature in humans is **37°C** (27°C / 37°C / 47°C)

8 IDU 4b Signs of Life

Respiration is the process that occurs in our and releases the for life.

Body temperature

Person	Temperature (°C)
me	
my partner	37 C (about 36.5-37 C, the same as me).

By what process is your body kept warm? Respiration - the energy released from food in respiration is used to keep the body warm.

In mammals most of the energy from our food is used to keep us warm.

cells
energy
37 C (about 36.5-37 C).

Peas

Type of Pea	Temperature (°C)
live peas	Live peas: about 30 C - warmer than the room.
dead peas	Dead peas: about 20 C - room temperature.

What does this experiment show? _____

Living (germinating) peas respire and release heat energy, so the temperature rises; dead peas do not respire, so they stay cool.

Why do doctors check our body temperatures? Temperature much above or below 37 C can be a sign of illness or infection.

Do you think that temperature alone is a good indication of life?

No - cold-blooded animals have the same temperature as their surroundings, so other signs of life (movement, respiration) must be checked too.

Hydrogen-carbonate indicator

Hydrogen Carbonate indicator solution can be used to test for Carbon Dioxide.

- Yellow indicates high levels of CO₂
- Pink/Red indicates normal levels of CO₂
- Purple indicates low levels of CO₂

Tube	Colour of indicator (pink/yellow/purple)
A	
B	
C	
D	A - yellow: the maggots respire, adding carbon dioxide.
E (pondweed in the light)	B - yellow: the germinating peas respire, adding carbon dioxide. C - purple: in the light the pondweed photosynthesises faster than it respire, using up carbon dioxide.

C - yellow: in the dark the pondweed only respire, so carbon dioxide increases.

What is the purpose of tube D? _____

D - pink: the control tube, showing the colour of the indicator in normal air.

Why did tube C have metal foil around it? to keep the pondweed in the dark, so it could not photosynthesise and only respired.

What does tube A and B show? How animals (maggots) and germinating seeds (peas) respire, producing carbon dioxide which turns the indicator yellow.

Tube D is the control - it shows the normal colour of the indicator in ordinary air, so the other tubes can be compared with it.

What does tube E show? The pondweed in the light photosynthesises, taking in carbon dioxide, so the indicator turns purple (low carbon dioxide).

When do you think plants respire? at the time - day and night. Plants respire 24 hours a day; they only photosynthesise in the light.

8 IDU 4c Comparing Combustion and Respiration

What happens when a fuel burns? Is it similar to Respiration?

Your teacher will demonstrate the combustion of a fuel. Label the diagram using words from the list below.

delivery tube bung funnel stand U-tube large beaker iced water boiling
tube limewater thermometer candle conical flask

Recording your results

Now write the results from the demonstration in the table below:

Observation	Before experiment	After experiment
Appearance of fuel		
Appearance of limewater		
Appearance of U-tube		
Temperature shown on thermometer (°C)		

How do you know that energy has been given off?

The thermometer reading rises (the water warms up), showing that heat energy has been given off.

What gas was produced in this experiment, how do we know this?

Write the word equation for the reaction using Glucose as the fuel:

Carbon dioxide - the limewater turned cloudy/milky.

Glucose + oxygen → carbon dioxide + water (+ energy)

How does combustion compare to respiration?

Both use oxygen and a fuel and produce carbon dioxide and water; combustion releases energy quickly as heat and light, respiration releases it slowly in cells.

8 IDU 4d Review – Breathing and Respiration

- 1 Use the words in the box to complete the sentences below. You may need to use some words more than once.

blue	carbon dioxide	cleaner	cloudy	cobalt chloride
energy	glucose	thermal energy	limewater	lungs
	respire	warmer	water vapour	air
				oxygen
				pink

All organisms, animals and plants, respire all the time.

Respiration releases _____ from food. In humans a lot of this energy is released as thermal to keep us warm.

The food substance used in respiration is called _____.

The other reactant in respiration is the gas _____.

The chemical products of respiration are carbon dioxide and water.

Breathing is the movement of air in and out of the _____.

You can show that you produce carbon dioxide by breathing out into _____.

It turns from clear to cloudy.

You can show that you breathe out water vapour using _____ paper that turns from pink to _____.

The air we breathe out contains more water vapour and less _____ than the air we breathe in.

It also contains carbon dioxide and as well it is _____.

Explorers in the arctic need a lot of energy because they lose a lot of energy warming the _____ that they have inhaled and exhaled.

limewater
cobalt chloride
oxygen
energy

lungs

energy

8 IDU 5a Respiration Crossword

- 1 Fill in the missing words. Check you have the right answer by putting the words in the grid. The numbers in brackets show where the words go in the grid.

All the (9) in your body need energy. Aerobic respiration is the process that combines glucose and oxygen to release energy. Food and oxygen are carried to the cells in the (5)

Aerobic respiration takes place when cells are getting plenty of oxygen. The word equation for aerobic respiration is:

(4) + oxygen → (1) (3) + (2) (+ (7))

If there is not enough oxygen getting to the cells, (6) ~~aerobic~~ **anaerobic** respiration takes place. This produces (8) acid as a waste product, which makes your muscles ache.

- 2 a Write down the word in the shaded squares.
 b Explain what these things are, and why they are important for respiration.

.....

.....

.....

.....

8 IDU 5b Breathing and Respiration

1 a Write down the letters A–F.
Write the name of the part corresponding to each letter.

b How do the parts labelled C allow oxygen to get into the blood easily?

A = trachea (windpipe), B = bronchus, C = air sacs (alveoli), D = lung, E = rib, F = diaphragm.

The air sacs have thin walls, a large surface area and a rich blood supply, so oxygen diffuses quickly into the blood.

2

Drawing P.

Drawing Q.

The ribs move up and outwards and the diaphragm flattens, so the chest volume increases and air is drawn in.

It relaxes and moves up into a dome shape, so the chest volume decreases and air is pushed out.

Drawing P - the lungs are full of air (that person has just inhaled).

a Which drawing shows someone with lungs full of air?

b What happens to the parts labelled X when someone inhales?

c What moves these parts? *The intercostal muscles between the ribs and the diaphragm muscle.*

d What happens to the part labelled Y when someone exhales?

3 Gas exchange happens in the lungs. Explain what 'gas exchange' is.

4 Oxygen and carbon dioxide are carried in the blood, through tubes.

a What is the general name for a tube that carries blood?

b How is oxygen carried in the blood? *By red blood cells (as oxyhaemoglobin).*

c How is carbon dioxide carried in the blood?

d What is the name of the process that requires the oxygen?

e Copy and complete the word equation for this process.

_____ + glucose *oxygen* → carbon dioxide + *water* (+ energy)

8 IDU 5c Breathing (Part 2)

1 Label the diagram with the following words.

air sacs
diaphragm
lung
rib
windpipe

This drawing shows the breathing system and some of the bones in the chest.

2 Fill in the missing words in these sentences, using the words in the box. You may need to use some words more than once.

blood vessels	carbon dioxide	exhaling
heart	inhaling	lungs
	oxygen	respiration

Breathing *in* is called inhaling. Air goes into the lungs. A gas from the air called oxygen goes into the blood. A waste gas dissolved in the blood, called carbon dioxide goes into the lungs. Breathing *out* is called exhaling. When we do this, the waste gas goes into the air. oxygen gas, from the air, is needed by the cells in the body for respiration. The gas is carried by the blood. The heart is an organ that pumps the blood. The blood travels around the body in tubes called blood vessels.

carbon dioxide
respiration
heart
blood vessels

8 IDU 5d Air Sacs in the Lungs

The diagram shows an air sac from a lung.

1 What sort of blood vessels are found surrounding air sacs? _____

2 a Draw some red blood cells on the diagram. Do not shade them in.

b Blood cells change colour slightly depending on how much oxygen they are carrying (they are bright red when carrying a lot of oxygen). Find two coloured pencils, one bright red and one dark red. In the correct areas, shade some of the red blood cells dark red and some of them bright red.

3 a On the diagram, draw a labelled arrow showing which direction oxygen particles are going.

b On the diagram, draw a labelled arrow showing which direction carbon dioxide particles are going.

c Your two arrows show a process that occurs in the lungs. What is the name of this process? Gas exchange (diffusion).

Capillaries.

d In which part of the blood is carbon dioxide carried in the plasma, as dissolved carbon dioxide.

· Draw red blood cells inside the blood vessel (capillary) - do not shade them in.

· Shade the cells colouring bright red near the air sac (lots of oxygen) and dark red further along the capillary.

8 IDU 5e Lung Diseases

The breathing (or respiratory) system has various adaptations to prevent microbes, which might cause an infection, from entering the lungs.

In the nose, hairs filter out dust, and microbes are trapped in a sticky fluid called **mucus**. We usually swallow the mucus or get rid of it by sneezing. The mucus also contains a chemical that kills microbes.

Once air enters the trachea and bronchi it passes over more mucus that is produced by special cells called **goblet cells**. This traps even more microbes. To prevent a build up of 'dirty' mucus in the air passages, which might cause an infection, there are tiny hairs called **cilia** lining the trachea and bronchi. These are constantly moving and they waft the mucus up and out of the lungs to the back of the throat where it is swallowed. If a large object is accidentally inhaled it is usually expelled quickly by coughing.

Despite these mechanisms we all suffer from infections of the respiratory system from time to time. Any part of the system can become infected. For example, **laryngitis** is when the **larynx**, or voice box, becomes swollen and inflamed. This is often associated with a loss of voice and sore throat. **Tracheitis** is inflammation of the trachea. **Bronchitis** is when the bronchial tubes become inflamed. This can make it difficult to breathe because these tubes are fairly narrow and any swelling will partially block them. All these infections are associated with an increased production of mucus that also blocks the airways. For this reason coughing is usually another symptom of a chest infection.

Surrounding each lung are two delicate membranes called the **pleural membranes**. One membrane lines the chest cavity and the other covers the lung. Between them is a fluid, which acts as a lubricant so that the lungs can move easily when you breathe in and out.

Pleurisy is an infection of the pleural membranes. They cannot slide over each other easily and this makes breathing very difficult and painful.

Many people today suffer from **asthma**. This is when the muscles in the walls of the tiny tubes, called bronchioles, contract making them become even narrower. This makes breathing difficult. Asthma sufferers must always carry an inhaler. This contains a drug that makes the muscles relax, so the tubes widen again.

Tuberculosis, or TB, is a very serious lung disease caused by a bacterium that destroys the lung tissue and causes fever and weight loss. TB used to kill many people. Nowadays it is rare because most people are **immunised** against it.

Lung cancer is a major killer disease today. It is when cells in part of the lung grow and divide uncontrollably. Eventually a large lump forms which blocks some of the airways. If it is left untreated it grows bigger and bigger making breathing more and more difficult. Some of the cancer cells may break off and get carried to other parts of the body where they can cause another cancer to form. This is called a secondary growth. People who smoke are at a much greater risk of developing lung cancer than non-smokers.

Most people are immunised (vaccinated) against TB, so very few people catch it.

- 1 List the ways in which the body is adapted to prevent microbes from entering the lungs.
- 2 a What is the proper name for the voice box?
b What is an infection of the voice box called?
c What are the symptoms of this disease?
- 3 Why do you often cough when you have a chest infection?
- 4 Describe what pleurisy is.
- 5 a Why do asthma sufferers find it hard to breathe?
b How do inhalers help them to breathe?
- 6 a Why is it rare for someone to catch tuberculosis today?
b Find out what tuberculosis used to be called.
- 7 Describe what happens when lung cancer develops.

The inhaler contains a drug that relaxes the muscles, so the tubes widen again and air can flow.

Consumption (also called the 'white plague').

Hairs in the nose filter dust and microbes; mucus traps them; cilia waft the mucus to the throat to be swallowed; coughing and sneezing expel them; stomach acid kills microbes.

The larynx.

Laryngitis.

A sore throat and loss of voice (swollen, inflamed voice box).

Extra mucus is produced which blocks the airways, so coughing is needed to clear the mucus (and the microbes) out of the lungs.

Pleurisy is an infection of the pleural membranes, so they cannot slide over each other easily; breathing becomes very painful and difficult.

The muscles in the walls of the bronchioles contract, narrowing the tubes, and extra mucus blocks them, so air cannot flow easily.

8 IDU 6a Blood Vessels and Circulation

- 1 Colour all the veins in dark red and all the arteries in bright red and colour in the key.
- 2 Fill in the missing words in the sentences below.

• Colour all the veins dark red and all the arteries bright red, and fill in the key with the same colours.

- 2 Look at these pictures of blood vessels.

A

B

C

A = artery, B = vein, C = capillary.

Tissue fluid.
Plasma.
Oxygen.

- a Add the correct label to each picture: **vein, artery, capillary**
- b What is the name of the liquid that leaks out of capillaries and surrounds the cells?
- c Blood consists of cells and a liquid. What is the name of this liquid?
- d Name one substance that the liquid in part **c** carries. **Food substances** such as glucose (also carbon dioxide).
- e Name one substance that a red blood cell carries.

8 IDU 6b Investigating Strength of Blood Vessels

Safety:

Always wear gloves when handling animal material.

Watch the experiment at all times as when the blood vessel ring breaks, the falling masses may cause injuries.

Introduction:

Blood is pumped around the body by the heart and flows through arteries, capillaries and veins. The **aorta** is the **biggest** artery in the body and carries blood directly from the heart.

In this investigation you will compare the **strength of the aorta with another blood vessel**.

Procedure:

- 1) Record the original length of the blood vessel ring before adding any masses.
- 2) Suspend the blood vessel ring from a hook on a clamp stand and attach it to a 10g mass hook.
Record the extended length.
- 3) Remove the mass, record its recoiled length.
- 4) Load the ring with increasing masses until no further recoil takes place (the blood vessel does not return to its original length). At this point the blood vessel has reached its elastic limit.
- 5) Keep repeating until the blood vessel ring breaks.
- 6) Repeat whole experiment with a different blood vessel.

Results:

Blood Vessel	Mass at which elastic limit was reached (g)	Mass at which blood vessel snapped (g)

Conclusions:

The artery was stronger. An artery has a thick muscular and elastic wall to withstand the high pressure of blood pumped from the heart, so it does not burst.

Which blood vessel was stronger?

Explain your answer using your knowledge about the structure and function of blood vessels. Use diagrams if needed.

Muscle and elastic fibres in the artery wall stretch and recoil, keeping blood flowing under pressure. Veins have thinner walls, lower pressure and valves to stop backflow.

8 IDU 7a Heart Dissection

- 1 Colour the blood rich in carbon dioxide in dark red and the blood rich in oxygen in bright red.
- 2 Label the parts of the heart below.
- 3 Add arrows to show the direction of the blood flow.

Dissection notes and observations:

(you may draw diagrams or insert pictures here)

The heart had 4 chambers, a thick muscular wall on the left, valves between atria and ventricles, and a thick elastic aorta. The lungs were spongy, with bronchi and air sacs inside.

Respiration and Circulation Summary Cards

- 1 Label or cut out the statements and sort them into true and false sets.
- 2 Read the **true** statements and arrange them into a sensible order to produce two lists of summary statements. One list should be about **respiration** and the other about **circulation**.
- 3 Write out the statements onto **flash cards** or a **concept map**. This should help your **revision** notes.

Link the statements to the MYP concepts for this unit:

KEY CONCEPT – Connections

RELATED CONCEPTS – Consequences and Movement

TRUE: capillaries are very small blood vessels; the heart pumps blood around the body; veins carry blood back to the heart; arteries carry blood away from the heart.

Capillaries are very small blood vessels.	Respiration produces glucose.
Respiration produces water.	Capillaries are very small electrical wires.
Blood flows backwards and forwards in the blood vessels.	Respiration uses carbon dioxide.
Substances are carried from the blood in capillaries to tissues in a liquid called tissue fluid.	Respiration takes place all the time.
Blood is pumped around the body by the heart.	Respiration releases energy.
Anaerobic respiration uses oxygen.	Respiration uses glucose.
Veins carry blood back to the heart from the body.	Cells die when someone gets frostbite. Frostbite is caused by too little oxygen reaching the cells.
Arteries carry blood back to the heart from the body.	Respiration uses water.
Carbon dioxide is carried around the body attached to white blood cells.	Respiration uses up energy.
Anaerobic respiration means respiring without oxygen.	Respiration produces carbon dioxide.
Glucose is transported around the body in paper bags.	Respiration uses oxygen.
Oxygen is transported around the body by red blood cells.	Respiration occurs in all living cells.
The left side of the heart pumps blood to the lungs.	Capillaries have very thick walls.
Glucose is transported around the body dissolved in the plasma.	Carbon dioxide is carried around the body dissolved in the blood plasma.
The left side of the heart is bigger than the right because it pumps blood around the body.	Respiration produces oxygen.
Cells die if they don't get enough oxygen.	Respiration occurs only in plant cells.

FALSE: respiration uses carbon dioxide or produces glucose/oxygen; blood flows backwards and forwards; anaerobic respiration uses oxygen; capillaries have thick walls; left side pumps to the lungs.

Respiration list: respiration uses glucose and oxygen, releases energy, produces carbon dioxide and water, occurs in all living cells, takes place all the time, anaerobic respiration means respiring without oxygen.

Circulation list: blood is pumped by the heart; arteries carry blood away and veins back to the heart; capillaries are tiny vessels; oxygen is carried by red blood cells; CO₂ dissolves in the plasma.

Link to MYP concepts: Connections - respiration links to circulation; Movement - blood flow and breathing; Consequences - too little oxygen makes cells die (frostbite).

8 IDU Respiration, Digestion and the Circulatory Systems – Review Notes

Digestion

We need to eat a wide variety of foods to provide our bodies with all the substances that are needed. When we do this, we are said to have a **balanced diet**.

Substance needed	Examples	Why it's needed	Good sources
carbohydrate	starch, sugars	for respiration to release energy	pasta, bread, potatoes
protein		for growth and repair	meat, beans, fish
Fats and oils	Olive oil Animal fat	For our immune system and healthy skin and hair	Nuts, meat, seeds, dairy products
vitamins	vitamin C	for health We need to eat a wide variety of foods to provide our bodies with all the substances that are needed. When we do this, we are said to have a balanced diet.	fruits and vegetables – oranges contain a lot of vitamin C
minerals	calcium	for health protein - e.g. eggs, meat, beans, fish - for growth and repair of cells and tissues	fruits, vegetables and dairy products – milk contains a lot of calcium
fibre		for health; helps to keep our intestines clean stop them getting blocked up (constipation)	wholemeal bread Fats and oils - e.g. olive oil, animal fat - for our immune system and healthy skin and hair - nuts, meat, seeds, dairy products
water		for health; water is important solvent in the body	vitamins - e.g. vitamin C - for health (prevents scurvy) - fruits and vegetables; oranges contain a lot of vitamin C

- We can do **tests** to find out which substances are in foods. For example, **starch** makes iodine solution go a blue–black colour. If a food contains **fats** it leaves a greasy mark when rubbed on paper. **Sugars** can be tested by adding Benedict's solution. If this goes green/yellow/red then glucose is present.
- **Nutrition information** labels on foods tell us what the food contains. The labels also tell us how much chemical energy is stored in the food. The amount of energy is measured in **kilojoules (kJ)**.
- Eating too much of some foods can cause problems. Too much fat may cause **heart disease**.
- To make use of the food, our bodies need to break it up into smaller sized molecules. This is called **digestion**. Digestion turns large **insoluble** substances into small **soluble** ones. The organs of the **digestive system** help us **digest food**. The organs of the digestive system help us digest food.

- Many of them produce **enzymes** (chemicals that break up food).

Putting food in the **mouth** is called feeding or **ingestion**. The teeth grind up the food and mix it with a **digestive juice** called **saliva**. Digestive juices contain **enzymes**.

Food is swallowed down the **gullet** (or **food pipe**). The muscles above the swallowed food get smaller (they **contract**) pushing the food down.

The **large intestine** removes water from the food that cannot be digested.

Food that cannot be digested forms **faeces**. Faeces are stored in the **rectum**.

Saliva is produced by the salivary glands. Saliva breaks down starch into sugar.

In the **stomach**, strong acid is added to the food and more digestive juices are added to break down proteins into amino acids.

In the **small intestine** more digestive juices are added. Carbohydrates are digested into sugars. Sugars and amino acids are small and so can be taken into the blood stream in the small intestine. The food substances are **absorbed**.

Faeces are eventually pushed out of the **anus**. This is called elimination or **egestion**.

To help absorb the digested food, the small intestine is covered with **villi**. These increase the surface area.

The digested food substances are carried around the body in the **blood**. The blood travels through **blood vessels**. **Arteries** carry blood away from the heart and **veins** carry blood towards the heart. The smallest blood vessels are **capillaries**. Substances enter and leave the blood through capillaries. Cells get the substances they need from the blood in capillaries.

Cells need food substances to ~~cells~~ **Cells need to release energy and make new substances.**

- release energy
- make new substances.

Cells use a **chemical reaction** called **respiration** to release energy from a sugar called glucose.

Cells use a chemical reaction called respiration to release energy from a sugar called glucose.

Respiration

All living cells need to **respire** to release energy. Energy is needed by organisms to help them move, grow and make new substances to help them stay alive.

Respiration normally requires oxygen and so it is called **aerobic** (with air) **respiration**. It is a series of **chemical reactions** which can be summarised in a word **equation**.

All living cells need to respire to release energy. Energy is needed by organisms to help them move, grow and make new substances to help them stay alive.

Glucose and oxygen are the **reactants**. Carbon dioxide and water are the **products**. Energy is released but it is not a chemical substance so we can either miss it out of the equation or put it in brackets.

Glucose is supplied by the **digestion** of carbohydrates. It is carried around the body dissolved in the **plasma** of the blood. The blood travels through **blood vessels** and is pumped by the heart.

The **heart** and the blood vessels form the **circulatory system**.

Glucose and oxygen are the reactants. Carbon dioxide and water are the products. Energy is released but it is not a chemical substance.

Glucose is supplied by the digestion of carbohydrates. It is carried around the body dissolved in the plasma of the blood.

- Label: blood from the lungs (pulmonary vein) into the left atrium; blood to the lungs (pulmonary artery) from the right ventricle; capillaries in lungs.
- blood to the rest of the body (aorta) from the left ventricle
- blood from the rest of the body (vena cava) into the right atrium
- Right side of the heart pumps blood to the lungs; left side pumps blood to the rest of the body.
- Valves stop the blood flowing in the wrong direction.
- small capillaries in intestine
- capillaries in leg
- capillaries in other parts of the body

The oxygen is absorbed from the air by the **lungs**. The lungs are part of the **breathing system**.

The **alveoli** give the lungs a large surface area so that oxygen can quickly **diffuse** from the air inside the lungs into the blood contained in **capillaries**. The walls of the alveoli and the walls of the capillaries are only one cell thick which also makes it easy for oxygen to diffuse into the blood. The oxygen is carried by the **red blood cells**.

Each air sac contains a number of tiny pockets called alveoli (singular alveolus).

Tissue fluid comes out of other capillaries around the body and bathes the tissues in the body. Tissue fluid contains oxygen and glucose. The cells take the oxygen and glucose that they need from the tissue fluid and put the carbon dioxide that is produced back into the tissue fluid. The tissue fluid soaks back into other capillaries and the carbon dioxide dissolves in the blood plasma.

capillaries
bronchus (plural bronchi)
The alveoli give the lungs a large surface area so oxygen can quickly diffuse from the air inside the lungs into the blood contained in capillaries.
The walls of the alveoli and the walls of the capillaries are only one cell thick, which also makes it easy for oxygen to diffuse into the blood.
Tissue fluid comes out of other capillaries around the body and bathes the tissues in the body.

In the lungs the dissolved carbon dioxide diffuses out of the blood and into the air in the lungs. That is why we breathe out (**exhale**) more carbon dioxide than we breathe in (**inhale**). The carbon dioxide is **excreted** by the lungs. Carbon dioxide can be tested for by using limewater which turns from clear to cloudy. Oxygen diffusing into the blood and carbon dioxide diffusing out of the blood is called **gas exchange**.

Composition of inhaled and exhaled air.

	Inhaled air	Exhaled air
nitrogen gas	78%	78%
oxygen gas	21%	16%
carbon dioxide gas	0.03%	4%
water vapour	variable	more

When you exercise, your **breathing rate** (number of breaths in one minute) and your **pulse rate** (number of times your heart beats in one minute) increase. This is because your cells need more oxygen and glucose for respiration.

In some diseases or when there is little air (e.g. at the top of a mountain) the body cannot get enough oxygen. People in these situations often feel short of breath and tired. If too little oxygen gets to cells, the cells cannot release energy from food and so they die.

When you exercise your breathing rate and pulse rate increase because cells need more oxygen and glucose for respiration, to release more energy.

In some diseases or at the top of a mountain the body cannot get enough oxygen. If too little oxygen gets to cells, the cells cannot release energy from food and so they die.

8 IDU Reflections on Inquiry and Interdisciplinary Science and PHE Link

Aim: Reflect on the Knowledge and Skills acquired in the Heart and Lungs through Inquiry

Questions asked	Answers found, and how we found them	Any further questions?
Factual What is the structure and function of the circulatory system? What is the structure and function of the respiratory system? What are the essential nutrients for a balanced diet? What are the short and long term effects of exercise on the body systems? How do organisms have energy for life functions? The circulatory system is the heart, blood vessels (arteries, veins, capillaries) and blood. It transports oxygen, glucose and other substances and removes carbon dioxide.		
Conceptual How does a circuit plan address areas of cardio & muscular strength, and endurance? How do body systems adapt to changing training methods?	The respiratory system is the trachea, bronchi, bronchioles and alveoli. It takes oxygen into the blood and removes carbon dioxide (gas exchange). Carbohydrates, proteins, fats and oils, vitamins, minerals, fibre and water. A balanced diet contains all of them in the right amounts.	Short term: faster breathing and pulse rate, sweating, tired muscles. Long term: stronger heart, larger lung capacity, stronger muscles and less body fat. Glucose from digested food is respired with oxygen in cells to release energy for movement, growth and making new substances.
Debatable To what extent do global governments promote health and fitness? To what extent does a health and nutrition address physical wellness? Good nutrition and fitness education improve wellness, but cost and access to healthy food limit it, so the effect varies between people and countries.	Plan circuits using aerobic work for cardio and resistance work for muscular strength, with rest between stations, using FITT (frequency, intensity, time, type). Training makes the heart muscle thicker, increases stroke volume and the number of capillaries, and muscles use oxygen more efficiently so they tire less. Governments can run campaigns and build facilities, but they also profit from fast food, so promotion is limited and individuals still choose whether to be fit.	

Appendix - answers with no space on the original page

These belong to the printed question on the page shown.

p24: Gas exchange is when oxygen diffuses from the air in the alveoli into the blood, and carbon dioxide diffuses from the blood into the alveoli to be breathed out.

p24: A blood vessel.

p24: Dissolved in the plasma.

p24: Respiration (aerobic respiration).

p28: Cells in part of the lung grow and divide uncontrollably, forming a lump that blocks the airways and makes breathing harder; cells can break off and form secondary cancers elsewhere.

p35: minerals - e.g. calcium - for health (strong bones and teeth) - fruits, vegetables and dairy products; milk contains a lot of calcium

p35: fibre - e.g. wholemeal bread - for health; helps keep our intestines clean and stops them getting blocked up (constipation)

p35: water - for health; water is an important solvent in the body

p35: We can do tests to find out which substances are in foods. Iodine turns blue-black with starch; fats leave a greasy mark on paper; Benedict's solution turns green/yellow/red with sugars.

p35: Eating too much of some foods can cause problems. Too much fat may cause heart disease and obesity.

p35: To use the food, our bodies need to break it up into smaller sized molecules. This is called digestion. Digestion turns large insoluble substances into small soluble ones.

p36: In the small intestine more digestive juices are added. Carbohydrates are digested into sugars. Sugars and amino acids can be taken into the blood stream in the small intestine.

p36: Food that cannot be digested forms faeces. Faeces are stored in the rectum. Faeces are eventually pushed out of the anus. This is called elimination or egestion.

p36: Digested food substances are carried around the body in the blood. Arteries carry blood away from the heart and veins carry blood towards the heart.

p36: The smallest blood vessels are capillaries. Substances enter and leave the blood through capillaries. Cells get the substances they need from the blood in capillaries.

p38: In the lungs the dissolved carbon dioxide diffuses out of the blood and into the air in the lungs, which is why we exhale more carbon dioxide than we inhale.

p38: Carbon dioxide is excreted by the lungs. It can be tested for using limewater, which turns from clear to cloudy.
